## **ACKNOWLEDGMENTS**

This 2002 303(d) report is the result of the combined efforts and cooperation of various staff members of the Department of Environmental Quality (DEQ), other state agencies, as well as input and assistance from various public and private organizations.

The primary information for the nonpoint source assessment was collected and analyzed by the Department of Conservation and Recreation (DCR). Other health-related, water quality information was provided by the Virginia Department of Health (VDH). The overall water quality assessments for the individual water bodies were conducted by the water quality planning staff in each of the DEQ regional offices, using data collected by regional ambient monitoring program staff and regional biologists within their respective regional boundaries. The Virginia Division of Consolidated Laboratory Services (VDCLS) analyzed the ambient station samples and provided the results to the regional DEQ offices. The DEQ Fish Tissue program collected fish tissue and sediment samples at selected sites across the state. Analysis of the fish samples was performed by the College of William and Mary/Virginia Institute of Marine Sciences and the results were also incorporated into the overall river basin assessments. The DEQ Chesapeake Bay Program (CBP) provided sampling data which were incorporated into the overall coastal and estuary assessment. The DEQ Water Quality Assessment staff at the central office assisted with much of the final preparation of the contents of this report.

Many other contributors provided information used in the overall assessment of water quality in Virginia, from which the 303(d) report was developed. These contributors include local governments, regional agencies and various citizen groups interested in water quality issues.

Additionally, monitoring data, reporting guidance and other water quality information have been provided by several different federal programs. These include the U.S. Geological Survey, the U.S Forest Service, the National Park Service, the National Oceanic and Atmospheric Administration, the U.S. Fish and Wildlife Service and several sections within the Environmental Protection Agency.

We sincerely appreciate the contributions of all of those individuals and groups that have assisted in preparation of this report. Without their assistance, this 303(d) Report could not have been completed.

Our thanks to all contributors,

Darryl M. Glover Water Quality Monitoring and Assessment Manager Virginia Department of Environmental Quality
